

Fun with Buildings!

Activity Sheet

Question 1

Remember, any force is a mixture of the acceleration of the object, and how heavy the object is!

Work out these with the help of a parent! Let's say for this sake that gravity's acceleration is 10m/s^2 ! I'll do an example first for number 1! You do 2-5!

1. How much force is on a 10 kg ball due to gravity?
That's easy! $10 * 10 = 100$ *Newtons*! Because it's the weight, multiplied by that acceleration I said (10 in our case).
2. How much force is on a 100 kg motorbike due to gravity? (I'll give you the answer to this one, but you have to figure out how I got it!):
_____ * _____ = 1000 *Newtons*!
3. How much force is on a 40 Kg bag of sand?
_____ = _____ *Newtons*
4. How much force is on a car that weights 1000kg due to gravity?
_____ = _____
5. How much force is on a small ant that weighs 0.02kg due to gravity?
_____ = _____

Question 2

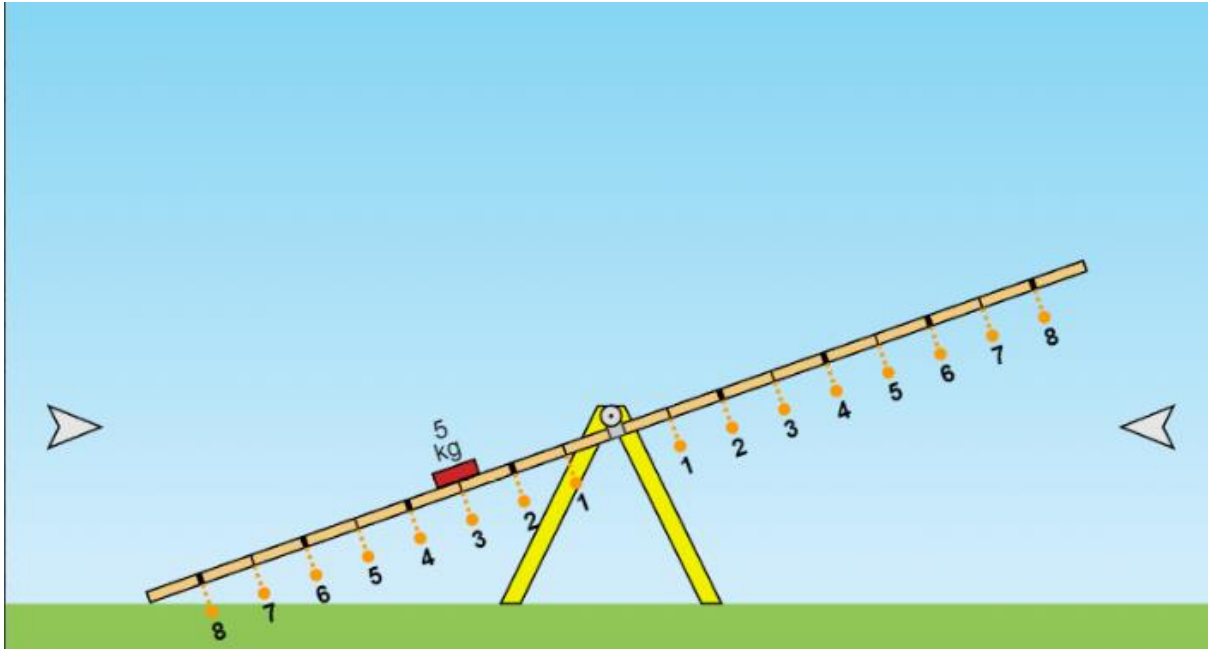

Balancing act!

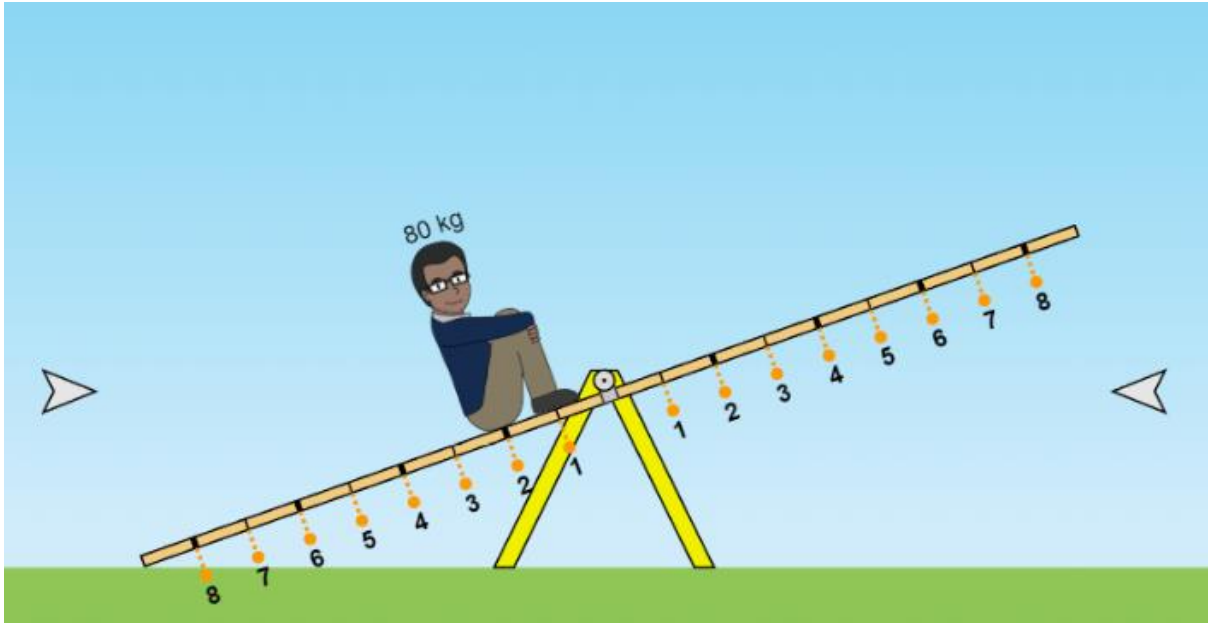

Help me balance these See-saws!

Use your knowledge from class to help me balance these see-saws! Draw in where you would put a weight, and how heavy in the images below! Get a parent to help if you need to!

Don't forget, the moment (what's causing the see-saw to tilt) is the Force (the weight here!) multiplied by the distance!

And finally! Can you work out the weight of the box?

Box B = _____

Question 3

Your Own Building!

It's time! You did it! Design your own building below, and name it! Don't forget to specify what it's for, and where you would put it in a city!

Here's my building! It's called _____!
